No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                Score

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

BVO

The present invention is concerned with methods of using C. elegans identify compounds which are capable of up- and down-regulating the activity of the sarco/endoplasmic reticulum calcium ATPase (SERCA). protein is involved in cell signalling, and elevated levels affect cellular processes such as contraction, secretion and cell cycling.

                                                                      The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has present a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte or cell sample that sequence represents a primary rat hepatocyte or contents.

Phospholamban polymorphism assessment in individual, for determining for developing cardiovascular disease, by comparing analysis of the nucleotide fragment with a predetermined phospholamban nucleotide sequence risk

WPI; 2004-689841/67

Claim 15; SEQ ID NO 1; 15pp; English

The invention relates to a method of phospholamban polymorphism assessment in an individual which comprises comparing the analysis nucleotide fragment with a predetermined phospholamban nucleotide fragment to determine whether the individual carries a phospholamban polymorphism. The methods and phospholamban polymorphism. are useful for determining an the analysis polymorphism the
